

The **camix**-Computer Aided Maintenance Xenter - application is an in-house product by Bilfinger GreyLogix (BGx) and has been developed specifically to support maintenance personnel with PCS troubleshooting. By simplifying the fault finding process and speeding up the debugging phase, **camix** is a significant contributor to economical plant operation.

BGx delivers **camix** in a pre-configured Microsoft Surface Tablet, giving your maintenance team the portable advantage of immediate access to relevant data for the cabinet equipment wherever they are at that moment. A simple scan of the cabinet-specific QR code, which is affixed to every BGx switch cabinet, helps maintenance staff to quickly address failures and evaluate optimum solutions.

Knowing the growing importance of digital mobility and connectivity, we've integrated **camix** with the function, **caw** - Computer Aided Wiring - for recording red markups or alterations to the switch cabinet and sending them securely via e-mail to Bilfinger GreyLogix for revision.

#### Maintenance personnel gain immediate access to

- 2D design plan for your switch gear panels
- Paperless circuit diagram (editable for red markups)
- Online shopping cart for rapid ordering of spare parts
- Technical documentation for integrated components
- Maintenance history of your cabinet

#### All advantages at a glance

- Fast troubleshooting thanks to access to all technical documents via QRC scan
- Paperless digital documentation
- Electronic red markups to circuit diagrams
- Direct ordering of spare parts through the user interface
- Easy and intuitive operation via touchscreen or with a tablet pen

#### Scope of delivery
